

WELCOMES YOU TO THE *SAPLING STACK BRACKET*

Your new *Sapling Stack Bracket* was designed to give the smokestack extra stability whether you are sugaring, grilling, smoking or baking on your *Sapling*.

Installing your *Sapling Stack Bracket*

You will need:

1. an electric drill with a 3/32" bit; and
2. a Phillips screwdriver.

To install your *Sapling Stack Bracket*, remove the stainless-steel bracket and two (2) screws from the shipping envelope or box. Ensure that the flue takeoff, elbow and at least one length of stovepipe are installed on your *Sapling*.

Adjust the 90° elbow so that the exit of the elbow is pointed straight up. Looking at your *Sapling* from the stack-end (the back), position the stack bracket so that the bent end is flush with the back of the barrel, and the straight end is flush with the elbow above the elbow's uppermost adjustable crease (see below). Mark the position of the predrilled hole on the back of the barrel with pencil, chalk or nail. Predrill a hole in the barrel. Using one of the last two of the screws provided, affix the stack stabilization bracket to the barrel. Use the last self-tapping screw to affix the bracket to the side of the elbow (this metal is thinner than the barrel and doesn't need to be predrilled).
